

- A new level of security and convenience
- Interchangeable between deadbolt and deadlatch locking
- No knobs or levers needed to operate the doors
- New elegant design and low cost
- Easy to install: Only a screw driver is needed
- Ten Years warranty
- American design; patent pending

The Flex series heralds a new generation of door locking systems featuring advanced interchangeable technology in an attractive and affordable form.

Developed by Tychi Systems of Salem, New Hampshire, the Flex series fits any door in your office or your home. Within its smooth exterior and elegant design, the interchangeable technology eliminates the need for knobs and levers.

Description

The Flex series is a keyed or keyless door lock system with a thumbturn located at the center of both sides of the door lock. A toggle push button to lock or unlock the door from inside of the door (400M only). A deadlatch can be replaced by a deadbolt for additional security. The Flex series comes with four models, the traditional keyed deadbolt, the keyed dead latch, the privacy deadbolt and the privacy deadlatch. All four models fit into a 2-1/8" lock hole and 1" latch hole and fit for door thickness from 1-3/8" to 2".

The lock can be set to an unlocked (by-pass) mode during times when open access is desired (400M only). The thumbturn on both sides act as the door knob or lever. Pulling the thumbturn to close the door and turning it to open the door.
